

CPT 262

Assignment 7

For this assignment you will create a front end and back end for your assignment website. All the files previously created to this point will need to be placed into a folder called admin8675309. There will also need to be created a page called backindex.php which will just have the header and footer. Also ensure that links to all the pages are on a navigation page which should be being accessed from the header. All prior permissions for the employees should still be available on these pages. For the back end, all previous pages created should be functional and working at this point as well.

For the front end, there should be a home page called frontindex.php that will also have a header and footer. The footer should only include the copyright symbol and the date. The header should show the name of the company and a logo, as well as a navigation area. The only links in the navigation should be home, which links back to frontindex.php; edit customer, which will allow the customer to edit only their information; insert ticket, which will allow the customer the ability to enter a ticket; and search ticket, which will allow the customer the ability to search only their own tickets. There should be a login for the customer that will be required before they can enter/search the tickets or change their information. The login on the front end should be different from the login on the back end.

Login for back end should have full permissions and be z@z.com with pw of z

Login for front end should be f@f.com with pw of f

Deliverables:

For this assignment you must have the requirements above completed as a website, created in an assignment7 folder inside your CPT 262 folder on the istwebclass server. DO NOT ZIP YOUR FILES ON THE WEBSERVER!!! In addition, also upload a zipped copy in the dropbox. You may also present your site and database at the beginning of the class this is due.
